# Package 'ukbbhelpr'

October 26, 2021

Type Package

THE Helper functions for UK Blobank data
Version 0.1.0
<b>Description</b> A collection of helper functions for working with UK Biobank data.
License MIT + file LICENSE
Encoding UTF-8
LazyData false
<b>Depends</b> R (>= 2.10)
Imports data.table, lubridate, stringr
RoxygenNote 7.1.2
Suggests testthat
R topics documented:
ehr_extract
visit
visit_cancer
visit_conditions
visit_extract
visit_family_history
Index 7

visit visit

ehr\_extract

Extract observations/test results from raw EHR data

#### **Description**

Extracts values from linked EHR data. Data is extracted from the value1 field with the exception of data provider 2 where values are extracted from value2 if value1 is empty. Units are taken from value3 for data provider 2 (otherwise units are unavailable). NA, zero and duplicate values are dropped.

#### Usage

```
ehr_extract(ehr_data, read_codes)
```

#### **Arguments**

ehr\_data Data table/frame with UK Biobank clinical event data i.e. gp\_clinical.txt.

read\_codes Values are extracted from these codes. Data table/frame with Read v2 (read\_2)

and CTV3 (read\_3) columns.

#### Value

Data table with value and unit columns.

visit

Example UK Biobank visit data set.

#### **Description**

Synthetic UK Biobank visit data for function testing and demonstration.

#### Usage

visit

#### **Format**

Data table with columns as set out below.

#### **Details**

Data is provided for 100 synthetic participants with two instances (visits) for 40% of participants. Fields provided are 50 (height), 53 (visit date) and 21002 (weight).

visit\_cancer 3

visit\_cancer

Extract self-reported cancer history

#### Description

Extracts self-reported cancer history in a "long" format that is easier to work with than "wide" as provided by UK Biobank.

#### Usage

```
visit_cancer(visit_data)
```

#### **Arguments**

visit\_data

Data frame/table with UK Biobank data. Must include 20001 and 20006 fields.

#### Value

Data table with eid, date, condition and reported columns. date is the reported date of diagnosis and reported is the date the cancer was self-reported to UK Biobank. condition is the cancer type coded as in https://biobank.ctsu.ox.ac.uk/crystal/coding.cgi?id=3.

visit conditions

Extract self-reported non-cancer medical history

### **Description**

Extracts self-reported non-cancer medical history in a "long" format that is easier to work with than "wide" as provided by UK Biobank.

#### Usage

```
visit_conditions(visit_data)
```

#### Arguments

visit\_data

Data frame/table with UK Biobank data. Must include 20002 and 20008 fields.

#### Value

Data table with eid, date, condition and reported columns. date is the reported date of diagnosis and reported is the date the condition was self-reported to UK Biobank. condition is the health condition coded as in https://biobank.ctsu.ox.ac.uk/crystal/coding.cgi?id=6.

visit\_extract

visit\_extract

Extract fields from UK Biobank visit data

#### **Description**

Extracts all instances/arrays of data for a UK Biobank field(s). See https://biobank.ndph.ox.ac.uk/showcase/to identify field codes.

#### Usage

```
visit_extract(visit_data, fields)
```

### **Arguments**

visit\_data Data frame/table with UK Biobank data.

fields Vector of fields to extract e.g. 50 or c(50, 21002). Field name will be identified

from UK Biobank schema. Alternatively, field names can be set using a named

vector e.g. c("height" = 50, "weight" = 21002).

#### Value

Data table with values of all instances/arrays for each field in "long" format i.e. eid, date of visit, field name and value recorded by UK Biobank.

#### **Examples**

```
## Not run:
# Load data
data_path <- ""  # add path to your data
visit <- fread(data_path)

# Extract a field
visit_extract(visit, 50)

# Extract multiple fields
visit_extract(visit, c(50, 21002))

# Manually specify a field name
visit_extract(visit, c("height" = 50, 21002))

## End(Not run)</pre>
```

visit\_family\_history 5

#### Description

Determines presence of a specified condition in the self-reported family history data. If multiple history fields are provided (e.g. history of mother and father), presence of the condition in either field determines a positive family history.

### Usage

```
visit_family_history(
  visit_data,
  fields,
  condition,
  collapse = TRUE,
  name = NULL
)
```

## **Arguments**

Vector of family history fields to extract e.g. one or more from 20107 (father), 20110 (mother) or 20111 (sibling).

Code for condition. Only a single condition at a time is currently supported. See https://biobank.ndph.ox.ac.uk/showcase/coding.cgi?id=1010 to identify condition codes.

Collapse Summarise results across all visit dates (default TRUE). If FALSE, the presence of the condition is provided at each visit date in the output table.

Optional column name for condition (default history).

#### Value

Data table with TRUE (condition was reported), FALSE (condition was not reported) or NA (unknown/no response).

#### **Examples**

```
## Not run:
# Load data
data_path <- "" # add path to your data
visit <- fread(data_path)

# Extract history for father
visit_family_history(visit, 20107, 9)
# Extract history for father, mother and siblings</pre>
```

visit\_family\_history

6

```
visit_family_history(visit, c(20107, 20110, 20111), 9)

# Name column in output
visit_family_history(visit, c(20107, 20110, 20111), 9, name = "diabetes")

# Get history reported at each visit date
visit_family_history(visit, c(20107, 20110, 20111), 9, collapse = FALSE)

## End(Not run)
```
